

A new dinosaur, *Khankhualuu mongoliensis*, was found in Mongolia. It is an early ancestor of T. rex and helps us learn about their hunting skills.

The dinosaur weighed 750kg, less than a T.rex. It had strong jaws for hunting, showing how early tyrannosaurs changed over time.

Fossils found in the 1970s were later found to be a new dinosaur species, showing tyrannosaurs moved between Asia and North America.
