

Doctors in the UK use "poo pills" with good bacteria to fight superbugs by replacing bad bugs in the bowel.

Superbugs are germs that don't die with medicine. They can make you sick. Poo pills might help get rid of them and make you better.

The pills help good bacteria stay in the bowel to fight superbugs. This might stop new infections from starting.

Poo pills might help people with weak bodies, like those having cancer treatment, by fighting infections without normal antibiotics.
